Dear Editor-in-Chief and Editorial Office,

Please consider the enclosed manuscript, “A Privacy-Preserving Provenance Plane for Reconstructable Fast Healthcare Interoperability Resources to Large Language Model Clinical Artificial Intelligence Transactions,” as a Regular Paper in IEEE J-BHI.

The work studies reconstructable provenance for one bounded synthetic FHIR-to-LLM clinical-AI transaction without storing hidden chain-of-thought or raw protected health information in an immutable log. The evaluation is an engineering study on synthetic fixtures, not a clinical-efficacy trial.

This manuscript is original and is not under consideration elsewhere. A related J-BHI manuscript by the same author on retrieval-augmented FHIR translation addresses a different research question.

No human subjects or identifiable clinical records were used.

Sincerely,

Satya Venkata Ranga Janaki Sriram
Mentey
